Do you have an idea to help against COVID-19, but lack the resources?

Society and workers around the globe face different challenges because of this disease. What is your daily challenge?

Tell us about your ideas!
AMable aims to help against COVID-19. The virus currently affects public and private life and, in many places, equipment is missing. That is where additive manufacturing can help.

AMable has been supporting SMEs in developing functional products that address specific challenges in their area of business. However, it is now time to use these resources and existing knowledge to support our society. Working environments are changing. Needs are changing.

Are you facing any challenge or obstacle because of the virus?

We ask you to tell us about the challenges that you see: What is missing to help us with the virus? Do you need a product, machine or tool in order to support efforts against the spread of the virus?

Do you have an idea on what would help?

We need people with great ideas on how to solve the challenges, created by this virus, through functional products or components for such products.

We can use additive manufacturing to help workers return to work. We can use AM to assure that our family and friends, and all people are able to carry on with their lives while being well protected.
